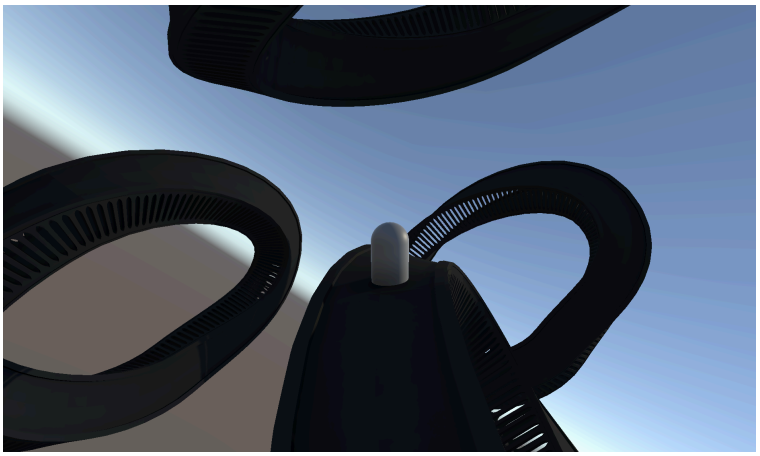
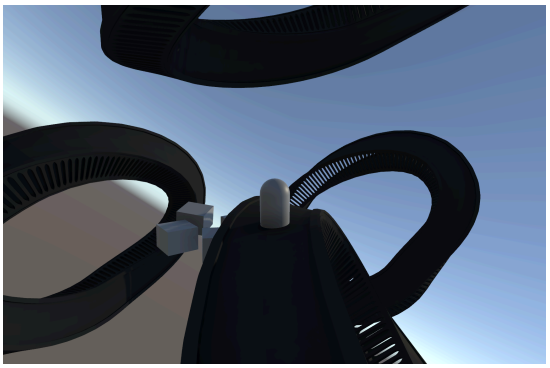
create bridge Start (**)
search endpoint mode (***)
Press [B]
[B] or [Esc]
Hover mouse over other shape
player switches to character perspective (*)
No
is bridge to location possible? (****)
character perspective
Reduce Character energy by [10]
Yes
Create full bridge, including (bezier) curve & intersection (*****)
show bridge endpoint at mousecursor location (***)
Press [C]

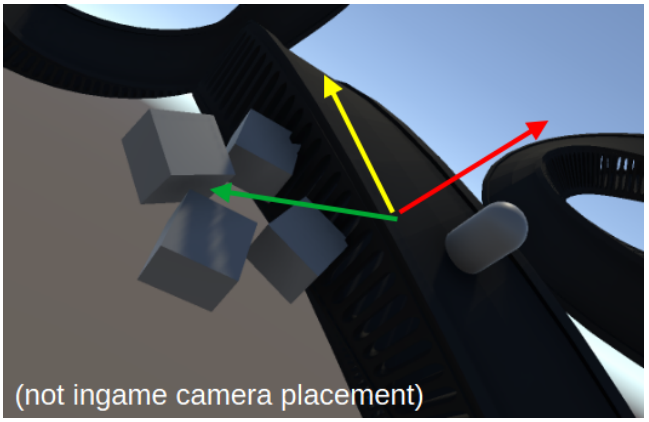


(*) The player takes control over a character
-> Character Camera (see camera document)

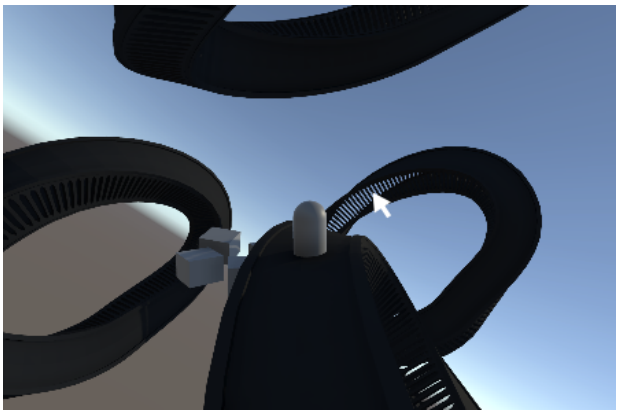


(**) Player presses “B” to start building a bridge. The start-point & end-point of bridges are going sideways off the path

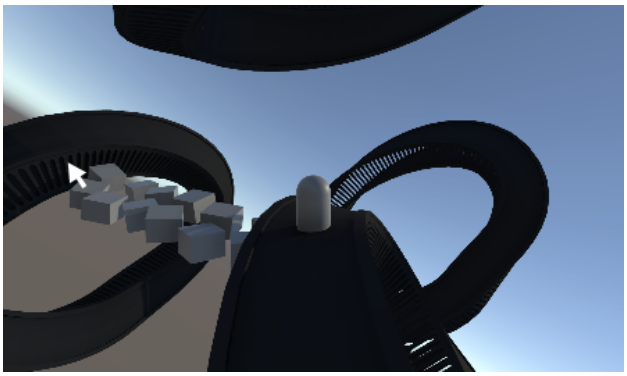
Red = normal of the curve
Yellow = direction the curve leads to
Green = orthagonal to the other two => starting vector of the bridge



(***) The player can freely control where the mouse points; Hovering over another location shows a bridge endpoint



(****) Some location (e.g. too far away; or tilted in a too different direction [=whatever is too hard to implement]) can't be reached with a bridge, so no other end of the bridge is foreshadowed



(*****) Creating a bridge = creating a curve & some objects along (& directly next to) the curve, that are facing according to the normals of the bridge at that point
